

UC3846

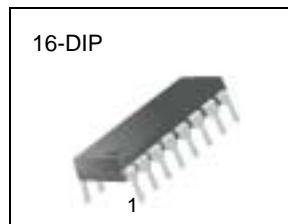

SMPs Controller

Features

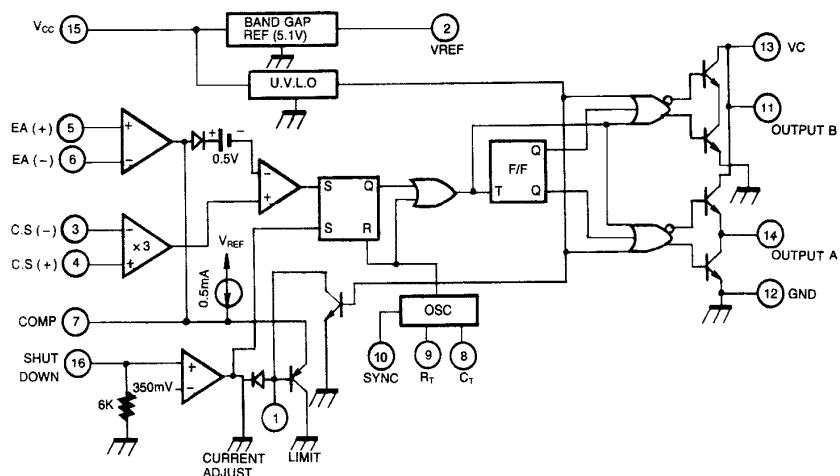

- Automatic Feed Forward Compensation
- Programmable Pulse by Pulse Current Limiting
- Automatic Symmetry Correction in Push-Pull Configuration
- Enhanced Load Response Characteristics
- Parallel Operation Capability for Modulator Power Systems
- Differential Current Sense Amplifier with Common Mode Range
- Double Pulse Suppression
- 200mA Totem-Pole Outputs
- $\pm 2\%$ Band gap Reference
- Under-Voltage Lockout
- Soft-Start Capability
- Shutdown Terminal
- 500KHz Operation

Description

The UC3846 control IC provides all of the necessary features to implement fixed frequency, current mode control schemes while maintaining a minimum external parts count. The superior performance of this technique can be measured in improved line regulation, enhanced load response characteristics, and a simpler, easier-to-design control loop. Topological advantages include inherent pulse-by-pulse current limiting capability, automatic symmetry correction for push-pull converters, and the ability to parallel "power module" while maintaining equal current sharing. Protection circuitry includes built-in-under-voltage lockout and programmable current limit in addition to soft-start capability. A shutdown function is also available which can initiate either a complete shutdown with automatic restart or latch the supply off. Other features include fully latched operation, double pulse suppression, deadtime adjust capability, and $\pm 2\%$ trimmed bandgap reference. The UC3846 features low outputs in the OFF state.

Notes :

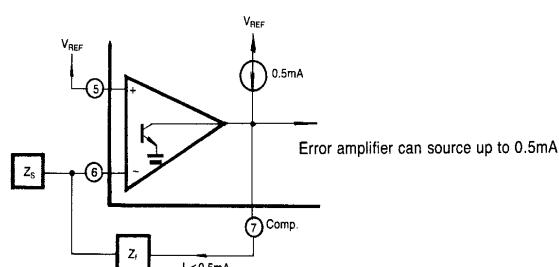

1. Parameter measured at trip point at latch with V5 = VREF, V6 = 0V
2. RT = 10KΩ, CT = 4.7nF
3. Amplifier gain define as:

$$G = \frac{\Delta V_7}{\Delta V_4}; \Delta V_4 = 0 \text{ to } 1.0V$$
4. Current into Pin 1 guaranteed to latch circuit in shutdown state.
5. Current into Pin 1 guaranteed not to latch circuit in shutdown state.
6. These parameters, although guaranteed over the recommended operating conditions, are not 100% tested in production.

OUTPUT DEADTIME(T_d)**Figure 1. UC3846 Oscillator Circuit**

Output deadtime is determined by the external capacitor, C_T , according to the formula: $T_d(\mu s) = 145C_T(\mu F) \left(\frac{12}{12 - \frac{3.6}{R_T(K\Omega)}} \right)$
For large values of R_T : $T_d(\mu s) = 145C_T(\mu F)$ Oscillator frequency is approximately

by the formula: $f_T(KHz) = \frac{2.2}{R_T(K\Omega)C_T(\mu F)}$
